Abstract
We designed a new lab science course on stratospheric balloononing (SB), titled Exploring the Edge of Space. The course, which starts in the upcoming semester, brings together two groups of students simultaneously: Mainstream liberal arts students and students in the college’s Honors program. The Honors students meet an additional hour weekly, review scientific literature extensively, and complete a capstone project. The course design is a collaboration between the physics and earth science departments at Central Lakes College, and is drawn on the five-year experience of the authors doing SB flights, many in collaboration with the Bemidji State University SB program. Unlike the past SB flights based on a semester project within pre-existing course curricula, the SB project is the kernel of this course. Therefore it will allow students to focus on learning the knowledge, skills, and attitudes necessary for the success of a large science-technology project while also fulfilling the outcomes to assure transferability. Those students who complete the major project activities including, but not limited to, developing experiment and revising draft reports will achieve the learning outcomes in the goal area of Natural Science of the Minnesota Transfer Curriculum as well as some of the Undergraduate Physics Laboratory Curriculum recommended by the American Association of Physics Teachers. Past experience has shown that students need to spend considerable time building competency in the areas of working in teams with diverse groups, working with technology, critical thinking, complex problem solving, written communication, applying knowledge in field situations, and science literacy in both earth science concepts and research. This course will focus on developing those skills, in an entirely inquiry-based, workshop-lab environment. Students will be guided through the learning of essential concepts, and supported in their own research, project development, and experimental design.

Introduction and rationale for new course
Since Fall semester, 2010, Central Lakes College HAB flights have collaboratively involved students in the following Geoscience and Physics/Engineering department classes: Earth Science and the Environment, Astronomy, Geologic Conference Honors Cosmology, Honors Earth Science and Environment, Concepts of Physics, Honors Physics/Astronomy, College Physics I & II, Classical Engineering Physics I & II, Circuit Analysis I & II, and Dynamics. Nine of the 10 flights have been with collaboration and support of Bemidji State University.

The HAB projects at CLC meet the following geoscience course outcomes:
- Correctly operate modern field and laboratory analytical equipment.
- Perform field based investigations using standard geoscience techniques.
- Describe and explain observations in the context of contemporary planetary and Geoscientific theories.
- Demonstrate written communication skills in science lab reports.

HAB projects at CLC also have the following components:
- They attempt to provide an authentic geoscience research experience, involving hypothesis, experimental design, fieldwork, experience with GIS, and data collection and analysis.
- Interdepartmental and intercollegiate collaboration, and student teamwork.
- Outreach and STEM recruiting.

Knowledge
- Applied geoscience and physics
- Applied physics mechanics, fluids, electricity, radiation

Skills
- Thinking and communicating with clarity and precision, in writing and speaking.
- Keeping a notebook recording observations, design plans, etc.
- Reading and following step-by-step instruction
- Basic numeracy and calculation
- Thinks critically, interdependently, flexibly, reflexively
- Working with others in teams
- Locating, organizing, evaluating information
- Being innovative, creative
- Analyzing and solving complex problems
- Transferring applying past knowledge to new situations
- Working with one’s hands, guided by the mind.

Attitudes
- Persistence
- Commitment to accuracy
- Questioning
- Openness to observation through all senses.
- Willingness to tolerate an environment of uncertainty
- Continuously learning

Overarching Course Goals
In this course students will:
- Demonstrate understanding and application of select topics in geoscience, physics, and technical (electromechanical systems)?
- Apply the process of experimental design to carry an idea from hypothesis to working scientific experiment.
- Apply their understanding of balloon systems to execute a successful stratospheric balloon flight.
- Honors students will demonstrate their ability to independently plan, and produce a capstone project of their own design, appropriate to the institutional honors designation.

Course Outcomes
Minnesota Transfer Curriculum (MnTC) & some AAPT Undergraduate Physics Outcomes

MnTC
- Demonstrate understanding of scientific theories
- Evaluate societal significance of experiments in atmospheric science
- Formulate hypotheses

MnTC and AAPT
- Present results and ideas with reasoned arguments supported by experimental evidence and utilizing appropriate and authentic written and visual forms.
- Analyze and display data using statistical methods and critically interpret the validity and limitations of these data and their uncertainties.
- Collect, analyze, and interpret real data from personal observations of "the physical" world to develop a physical and geoscienctific worldview.
- Develop, engineer, and troubleshoot experiments constructed for testing models and hypotheses while working within specific constraints such as cost, time, safety, and available equipment.

AAPT
- Become proficient using common test equipment in a range of standard laboratory measurements while being cognizant of device limitations.
- Develop abstract representations of real systems, study them in the laboratory, seek to understand their limitations and uncertainties, and use their models to make predictions.

Honors
- Compare a culminating report of their independent research of scientific literature
- Critically discuss scientific topics and
- Independently conduct an original capstone project, that embodies the spirit and purpose of the honors designation.

Assessment Instruments

Whole Class
- Reports
- Poster presentations
- Reading notes
- Design and develop experiment

Honors
- Reports
- Capstone project
- Extensive literature review

Tentative course outline for Fall Semester, 2016

Week 1 (mid-August)
- SB flight debrief and cleanup. Begin data analysis and report writing.

Week 2 (first week in September)
- Tethered launch on Central Lakes College campus grounds.

Week 3 (first week in October)
- Target launch date for SB flight
- Honors: Submit literature review of independent library research.

Week 4 (mid-October)
- SB flight data collection and scientific report writing continued.
- Week 5: Experiment assembly and testing.

Week 5
- Data analysis, report writing continued.

Week 6 (third week in November)
- Intro do scientific posters and poster sessions.

Week 7
- Draft report due for instructor comment. Continue working on poster.

Week 8 (midsemester)
- SB flight data collection and report writing.

Week 9
- All reports due. Scientific poster session fair on scheduled final.

Week 10
- Honors independent research report and capstone project report due.
