The "On Sale" Bar - UMC Electronics Co. v. United States - The Federal Circuit Rejects Requirement of Reduction to Practice

David Frischkorn
THE "ON SALE" BAR—UMC ELECTRONICS CO. v. UNITED STATES—THE FEDERAL CIRCUIT REJECTS REQUIREMENT OF REDUCTION TO PRACTICE

Article I, section 8 of the Constitution explicitly empowers Congress to secure to authors and inventors the exclusive right to control for limited time their writings and discoveries. With this power, Congress can promote the progress of science and the useful arts. Congress used this power to draft the patent laws of the United States, under which a person is entitled to protect his discovery unless certain conditions prevail. The right to obtain a grant of letters patent is limited by section 102(b) of Title 35 of the United States Code, which provides that an inventor will be entitled to a patent unless the

2. The word "patent" is derived from the Latin word patere meaning to be open. In common usage, "patent" signifies that which is open to view or open to public scrutiny. "Letters patent" refers to a written instrument which bears the seal of its author upon its face, but can be read without breaking the seal. Compare to "letters close" in which the document is first folded then sealed and cannot be read without breaking the seal. P.D. ROSENBERG, PATENT LAW FUNDAMENTALS 5 (1975).
4. Section 102 spells out what is not to be considered novel in the patent law sense. It contains seven provisions which involve both subjective and objective determinations:
   A person shall be entitled to a patent unless—
   (a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for patent, or
   (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of the application for patent in the United States, or
   (c) he has abandoned the invention, or
   (d) the invention was first patented or caused to be patented, or was the subject of an inventor's certificate, by the applicant or his legal representatives or assigns in a foreign country prior to the date of the application for patent in this country on an application for patent or inventor's certificate filed more than twelve months before the filing of the application in the United States, or
   (e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent, or
   (f) he did not himself invent the subject matter sought to be patented, or
   (g) before the applicant's invention thereof the invention was made in this country by another who had not abandoned, suppressed, or canceled it. In determining priority of invention there shall be considered not only the respective dates of conception and reduction to practice of the invention, but also the reasonable diligence of one who was first to conceive and last to reduce to practice, from a time prior to conception by the other.
invention was "in public use or on sale" in the United States more than one year before the date on which the inventor filed the patent application. 5

Congress structured section 102(b) as an instruction to the Patent Office to bar the issuance of a patent under certain circumstances. 6 However, section 102(b) is now primarily used as a defense by an accused patent infringer. 7 If the patentee violates the "on sale" provision of section 102(b), the result is a revocation, invalidation, termination, or cancellation of the patent grant and, therefore, an infringer would incur no liability. 8

The legislative history and judicial interpretation of the "on sale" bar dates back to the nineteenth century, when it first appeared in the Patent Act of 1836. 9 Since the early 1800's, courts have differed in their views as to what constitutes a "sale" and at what point the bar begins to run. 10 One issue which divided the courts was whether the patented invention must have been reduced to practice prior to the critical date 11 in order for the "on sale" bar to apply. 12 Until its decision in UMC Electronics v. United States, 13 the Federal Circuit had not squarely addressed whether reduction to practice was an absolute requirement of the "on sale" bar. 14

5. 35 U.S.C. 102(b). "A person shall be entitled to a patent unless—(b) the invention was in public use or on sale in this country, more than one year prior to the date of the application for patent in the United States."
7. See Note, New Guidelines for Applying the On Sale Bar to Patentability, 24 STAN. L. REV. 730, 730 n. 1 (1972) [hereinafter Note, New Guidelines]. This note formulates four public policies which support the "on sale" provision of section 102(b): (1) a policy against removing inventions from the public domain which the public justifiably comes to believe are freely available due to commercialization; (2) a policy favoring prompt and widespread disclosure of inventions to the public; (3) a policy preventing commercial exploitation prior to filing; (4) a policy of giving the inventor reasonable amount of time following sales activity to determine whether a patent is worthwhile. These policies were distilled from pronouncements of the courts and from the occasional policy statements of Congress. Countless number of judicial opinions have cited this note as the authority for the rationale behind the "on sale" bar.
10. See Zieg, Developments in the Law of "On Sale", 58 J. PAT. OFF. SOC'Y 470 (1976) (provides in-depth historical summary of many judicial opinions that have attempted to put forth an ordered system of rules for an "on sale" bar analysis).
11. The critical date is defined as the date one year prior to the date when the patent application covering the invention is filed in the U.S. Patent Office. See 35 U.S.C. § 102(b).
12. A term of art developed out of the complicated area of patent law known as interference practice. Basically, reduction to practice of an invention has occurred when the inventor's conception is embodied in such a form as to render it capable of practical and successful use. However, the invention need not be in perfect form or be a commercial success. See infra note 69 for a discussion of interference practice.
13. 816 F.2d 647 (Fed. Cir. 1987).
14. See infra note 69.
In *UMC*, the Federal Circuit held that reduction to practice was not an absolute requirement to the "on sale" provision of section 102(b).\(^{15}\) Further, the court found an inherent inconsistency in the well-accepted three-part test of *Timely Products Corp. v. Arron*.\(^{16}\) The Federal Circuit in *UMC* did not specify when the reduction to practice standard should apply,\(^{17}\) and further failed to formulate a standard to determine when something less than a complete embodiment of the patented invention would suffice to trigger the bar.\(^{18}\) Instead, the Federal Circuit favored an approach that balanced all the circumstances surrounding a sale or offer to sell against the policies underlying section 102(b).\(^{19}\)

This Note will provide a brief historical review of the more important developments of the "on sale" bar, with a detailed focus on recent court decisions. In addition, it will analyze the Federal Circuit's recent holding and dissent in *UMC Electronics v. United States*. This Note will also examine the affect *UMC* will have on future cases and its impact on the practice of patent law in general. Finally, a test will be proposed to determine at what point the "on sale" bar should begin to run.

I. BACKGROUND OF THE "ON SALE" BAR

A. Historical Review and Policy Considerations

United States patent law encourages scientific development for the benefit of the general public by granting limited monopolies to make, use, and sell inventions.\(^{20}\) In exchange for the monopoly, the patentee must disclose the detailed procedures, formulations and methods in the patent application which would allow one skilled in the art to reproduce the invention without undue experimentation.\(^{21}\) Complete disclosure is required so that other inventors are

17. 816 F.2d at 656.
18. Id. at 657.
19. Id. at 656.
20. See 35 U.S.C. §§ 101, 154 (1982). A patent is a grant by the government to an inventor of the right to exclude others from making, using, or selling the invention throughout the United States. What is granted is not the right to make, use, or sell, but only the right to exclude others. Therefore, an inventor may not necessarily have the benefit of a monopoly on his invention, he may have to secure a license under a prior patent to practice his own patented invention. The duration of the patent grant is 17 years. See generally P.D. Rosenberg, *Patent Law Fundamentals* (1975) (general treatise detailing history and policy rationale for United States patent system).
21. See 35 U.S.C. § 112. This section provides the statutory basis for a complete written disclosure of an invention. The patent is frequently referred to as a contract or franchise with consideration to the government being disclosure of the invention to the public and the right to use it after the grant expires. Accordingly, there is a failure of consideration invalidating the patent if the disclosure is insufficient to enable a skilled person to make and use the invention. 35 U.S.C. § 112 requires that the inventor set forth the best mode of his invention in such full, clear, concise and exact terms to enable any person skilled in the art to make and use the invention without undue experimentation.
provided with new ideas upon which to build and improve, thereby avoiding
the time and expense reinventing the patented would involve.\textsuperscript{22} When the
patent expires, the subject matter of the patent disclosure belongs to the
public.\textsuperscript{23} To prevent an extension of the limited monopoly and to further the
public interest in having an invention readily available, Congress enacted
section 102(b) of Title 35.\textsuperscript{24} The law places a strict limitation upon the time
in which an inventor may delay the filing of a patent application.\textsuperscript{25} This
limitation prevents the inventor from maintaining the secrets of his invention
while exploiting them through commercial sales activities and, when ultimately
faced with competition, applying for the limited monopoly.

The "on sale" bar provision first appeared in the Patent Act of 1836.\textsuperscript{26} In
1839, Congress added a two-year grace period in which the inventor could
market his product without losing the option of protecting his invention.\textsuperscript{27}
The inventor had to file a patent application with the Patent and Trademark
Office within two years of the date the invention was placed on sale. The
grace period gave the inventor the time needed to develop an invention from
its conception\textsuperscript{28} to a point where the inventor was confident that the invention
had utility for its intended purpose.\textsuperscript{29} In 1939, Congress amended the Act and
changed the grace period to one year.\textsuperscript{30}

Using the grace period provided by the statute, the inventor could readily
determine the critical date on which he would have to file his patent application.
However, the inventor could not readily determine what activities constituted
placing the invention on sale and how complete the invention needed to be to

\textsuperscript{22} See Note, \textit{New Guidelines}, supra note 7, at 731. Although 35 U.S.C. § 112 requires the
inventor to set forth an enabling disclosure, the courts have held that some experimentation by
others does not preclude enablement and that optimality of the invention is not required for a
valid patent. \textit{Atlas Powder Co. v. E.I. du Pont De Nemours & Co.}, 750 F.2d 1569 (Fed. Cir.
1984).

\textsuperscript{24} Colman, supra note 8, at 674-76; See Note, \textit{The "On Sale" Provision as a Bar to

\textsuperscript{25} See 35 U.S.C § 102(b) (1982) (inventor is allowed one year grace period following placement
of his invention "on sale").

\textsuperscript{26} See Act of July 4, 1836, ch. 357, § 6, 5 Stat. 119.

\textsuperscript{27} Act of March 3, 1839, ch. 88, § 7, 5 Stat. 354.

\textsuperscript{28} Conception, in the patent-law sense, involves the formation, in the mind of the inventor,
1929).

\textsuperscript{29} See Note, \textit{New Guidelines}, supra note 7, at 732 (Congress reasoned that inventor needed
a fixed period of time to make up his mind whether or not to file an application for patent).

\textsuperscript{30} S. REP. No. 876, 76th Cong., 1st Sess. 1-2 (1939); H.R. REP. No. 961, 76th Cong., 1st

In 1839, when the period of 2 years was first adopted, it may have been a proper
length of time for an inventor to make up his mind whether or not to file an
application for patent. Under present conditions, 2 years appears unduly long and
operates as a handicap to industry . . . .

One year is believed to be a very fair period to all concerned.

\textit{Id.}
trigger the running of the bar. This issue has proven to be extremely difficult for the courts to resolve.\textsuperscript{31}

Prior to 1975, courts mechanically applied the "on hand" rule.\textsuperscript{32} However, recent decisions have looked to four public policies underlying the "on sale" bar.\textsuperscript{33} The first three of these policies encourage prompt filing of a patent application and the fourth concerns fairness to the inventor.\textsuperscript{34} The first policy discourages the inventor from removing inventions from public use which, because of prolonged sales activity, the public believes are freely available.\textsuperscript{35} Anyone may freely make, use, or sell the invention if it is in the public domain.\textsuperscript{36} The inventor should not be able to preclude others from making or using the invention on the grounds that competition has developed.\textsuperscript{37} If an inventor could withhold his invention from the public until faced with competition, the competition would be penalized through loss of their investment.\textsuperscript{38}

The second policy favors prompt and widespread disclosure of new inventions to the public.\textsuperscript{39} Prompt disclosure furthers a fundamental goal of the

31. See generally Choate, "On Sale"—Review and Circumspection, 47 J. Pat. Off. Soc’y 906 (1965) (advocates that inventor who has created a new product and has moved it to the market place where it can create new business and employment should only be denied a patent if he fails to file within one year from the date of first delivery or successful commercial installation); Zieg, supra note 10, at 470 (relates importance of understanding complex law of "on sale" with question of "fraud on the Patent Office" and possible antitrust violations for enforcing a patent which is later held invalid).

32. A trilogy of cases were often cited because of the easily applied rules they set forth for determining whether an invention had been "on sale" more than one year prior to the patent application filing date. See B.F. Sturtevant Co. v. Massachusetts Hair & Felt Co., 124 F.2d 95 (1st Cir. 1941), cert. denied, 315 U.S. 823 (1942); Burke Elec. Co. v. Independent Pneumatic Tool Co., 234 F. 93 (2d Cir.), cert. denied, 241 U.S. 682 (1916); McCreery Eng’g Co. v. Massachusetts Fan Co., 195 F. 498 (1st Cir. 1912). In Sturtevant, the court found that a contract for made-to-order fans did not place the invention "on sale" before the critical date because the event which triggers the running of the bar was not the date of the order but rather the date the order was filled. 124 F.2d at 97. In Burke, the inventor contracted to sell his invention prior to the critical date, however, only a prototype was in existence, which had yet to be approved by the customer. 234 F. at 93. The court concluded that the invention was not "on sale" because the lack of approval prevented the invention from being "on hand" and ready for delivery. Id. Finally, in McCreery, the court held that the invention was not complete and not "on sale" prior to the critical date because only the plans were then in existence. 195 F. at 500-01.

Collectively, these three cases support the "on hand" doctrine which pre-1975 decisions relied on to support the theory that a rule otherwise would discourage and hamper inventors from going to persons for assistance and financing to complete the invention. In none of these cases were the public policies underlying the "on sale" bar discussed. The test was simply whether the invention was on hand ready for delivery prior to the critical date.

33. See Timely Prod. Corp. v. Arron, 523 F.2d 288 (2d Cir. 1975) (rejects rigid "on hand" doctrine in favor of legislative policy underlying § 102(b)). See generally Note, New Guidelines, supra note 7, at 736-39 (four public policies underlying the "on sale" bar are set forth).

34. See Note, New Guidelines, supra note 7, at 732-33.

35. Id. at 733. The policy of avoiding detrimental reliance on pre-application sales activity is well founded because the public may believe the invention is in the public domain. Id.

36. Id.

37. See supra note 20.

38. See Note, New Guidelines, supra note 7, at 733.

39. Id.
patent system. By allowing an inventor a limited monopoly, invention is encouraged. The public is benefitted by both the new invention and the dissemination of knowledge which others can use to further develop the state of the art.\textsuperscript{40} Without the grace period, the inventors would have a choice of filing a patent application which discloses the invention to the public, in return for a seventeen-year monopoly, or keeping their invention secret, hoping for permanent exclusivity.\textsuperscript{41} With the one-year grace period, inventors are forced to file promptly or risk possible forfeiture of their right to a patent because of prior sales activity.\textsuperscript{42} In this way, the "on sale" bar forces inventors to reveal new and useful information to the public, thus contributing to the spectrum of public knowledge.\textsuperscript{43}

The third policy which supports the "on sale" bar is the need to prevent the inventor from the exclusive commercial exploitation of his invention beyond the statutory seventeen-year period.\textsuperscript{44} If commercial exploitation was allowed beyond the one-year grace period, the inventor would have the best of both worlds—an indefinite time period without disclosure and a seventeen-year monopoly once a patent was granted.\textsuperscript{45} Therefore, the "on sale" bar forces the inventor to choose between seeking patent protection promptly following sales activity or taking his chances with his competitors without the benefit of patent protection.\textsuperscript{46}

The fourth and final policy favors the inventor. Once the invention is placed on sale, the inventor has one year in which he must decide whether or not pursuing patent protection is a worthwhile investment.\textsuperscript{47} Congress recognized that an inventor needs time to develop his ideas.\textsuperscript{48} Completeness of an invention furthers the goal of the patent system because patent applications based on incomplete experiments do not ordinarily promote the progress of the useful arts.\textsuperscript{49} Further, from the inventor's point of view, a filing based on an incomplete invention would be a waste of time and may necessitate multiple filings for the same basic idea.\textsuperscript{50}

Although recent decisions have focused on these four policies which underlie the "on sale" provision of section 102(b), the courts have traditionally adhered to rigid rules regarding the "on sale" bar.

B. General Rules

Once an alleged infringer has established "on sale" activities on the part of the patent owner, the burden generally shifts to the patent owner to show by clear and convincing evidence that the sale was for experimental purposes. If the patentee can prove that the sale or offer to sell was incidental to experimentation, then the bar is not triggered. In addition, no actual sale is required to find that an invention is on sale within the meaning of section 102(b). Under this provision, a mere offer to sell is sufficient. Moreover, a single sale or a sale that is conditional upon the satisfaction of the buyer, if executed prior to the critical date is sufficient to constitute a "sale" under the terms of the statute.

Many previous decisions involving section 102(b) failed to distinguish between the "public use" and "on sale" provisions. There is no Supreme Court decision which addresses the "on sale" provision. Current case law treats "public use" and "on sale" as separate events and one may occur without the other. The word "public" in section 102(b) modifies the word "use" and not the phrase "on sale." Accordingly, in Hobbs v. United States Atomic Energy Comm'n, the sale of a device to be used under conditions of government secrecy was sufficient to trigger the "on sale" bar even though

51. UMC Electronics Co. v. United States, 816 F.2d 647, 656 (Fed. Cir. 1987); D.L. Auld Co. v. Chroma Graphics Corp., 714 F.2d 1144, 1150 (Fed. Cir. 1983). There is an important distinction between the burden of proof which rests with the challenger to a patent and the burden of going forward which rests with the patentee. Under 35 U.S.C. § 282, an issued patent is accorded a presumption of validity and it is this presumption that a challenger must overcome by clear and convincing evidence. This presumption is never weakened nor is the burden of proof ever shifted to the patentee. If a challenger can establish prima facie sales activity, then it falls to the patentee to come forward with evidence, such as the experimental exception requirements, to defeat the prima facie case.

56. See, e.g., Hall v. MacNeale, 107 U.S. 90 (1883) (Supreme Court analyzed case in terms of a public use even though the claimed invention was clearly sold prior to the critical date).

59. 451 F.2d 849, 860 (5th Cir. 1971) (third party, without consent of the inventor, placed special valve on sale more than one year prior to filing date of inventor's patent application).
the sale was not public. Furthermore, the "on sale" bar is activated not only if the inventor makes the sale, but the sales activity of an unrelated third party also could trigger the running of the statutory time period. Similarly, a secrecy agreement under which an invention is disclosed to third parties is irrelevant to the question of whether the invention is on sale. In Jones v. Tucker Aluminum Prod. of Miami, a device which was on display in a showroom was considered on sale. The viewers could determine the method and design of operation by merely viewing the device. However, the shipment of a device from one corporate division to another within the same company does not place the device on sale. Even if the sale is consummated in a foreign country, the device is on sale if substantial prefatory sales activity occurs in the United States. Any offer to sell made in this country constitutes prefatory activity.

C. Completeness of the Invention

An invention is not considered complete until both conception and a reduction to practice have occurred. An invention remains a concept in the mind of the inventor until it is physically disclosed, either by oral or written means. When an inventor has completely formulated the means of solving a problem, conception has occurred. On the other hand, no invention is

60. See LaPorte v. Norfolk Dredging Co., 787 F.2d 1577, 1581 (Fed. Cir.), cert. denied, 107 S. Ct. 274 (1986). An exception to this general rule exists where a patented method is kept secret and remains secret after a sale of the unpatented product of the method. Such a sale prior to the critical date is a bar if engaged in by the patentee or the patent applicant, but not if engaged in by another. In re Caveney, 761 F.2d 671, 676 (Fed. Cir. 1985).

61. See In re Yarn Processing Pat. Litig., 360 F. Supp. 74, 80 (S.D. Fla. 1973) (demonstration of invention under secrecy agreement is legally irrelevant to "on sale" claim).

62. 233 F. Supp. 403, 409 (S.D. Fla. 1964) (public display of patented awning window prior to critical date allowed even layman of slight mechanical knowledge to determine method and design of operation).

64. See Robbins Co. v. Lawrence Mfg. Co., 482 F.2d 426, 434 (9th Cir. 1973) (United States company submits offer to sell tunnel boring machine to Australian company prior to critical date). See also In re Caveney, 761 F.2d 671, 676-77 (Fed. Cir. 1985) (British corporation sent samples to its exclusive United States distributor who then placed order; sale held to be "within this country").

65. Robbins, 482 F.2d at 434. See also Caveney, 761 F.2d at 676-77 (offer made from England directed to place of business in United States sufficient to find "on sale" activity).

66. See P.D. Rosenberg, Patent Law, supra note 2, at 136-37 (1975). There are two types of reduction to practice, constructive and actual. Constructive reduction to practice is deemed to have occurred upon the filing of a patent application which complies with the requirements of 35 U.S.C. § 112. Actual reduction occurs when the inventor has constructed or performed a process that embodies all the elements of the claimed invention. Both conception and reduction can occur simultaneously. Id.

67. See Colman, supra note 8, at 676-77.

68. See P.D. Rosenberg, Patent Law, supra note 2, at 136.
complete until it has been actually reduced to practice.\textsuperscript{69} Actual reduction to practice occurs when the inventor constructs a product or performs a process that is within the scope of the patent claims and demonstrates the capacity of the inventive idea to achieve its intended purpose.\textsuperscript{70} The difficulty in determining when an invention is completely functional and therefore reduced to practice is usually related to the complexity of the invention.\textsuperscript{71} For example, an invention based on new and complex technology requires extensive testing before an inventor is confident that his invention is complete and functional. A review of caselaw shows that courts use a less restrictive test in finding "reduction to practice" in connection with "on sale" bar situations than they use in an interference situation. In an interference situation the invention is normally required to be successfully tested in its intended environment.\textsuperscript{72}

For years courts struggled with the concept of reduction to practice. For example, in \textit{Americo Contact Plate Freezers v. Belt-Ice Corp.},\textsuperscript{73} the inventor constructed a wooden mock-up of a machine embodying the essential elements of the claimed invention. The invention contained moving parts to demonstrate its operation but was not actually capable of freezing packaged foods. The mock-up was shown to a potential customer over one year prior to the date the patent application was filed. That customer later contracted to purchase two machines.\textsuperscript{74} Construction of the machines began immediately after the contract was executed, however, the machines were not operable until after the critical date.\textsuperscript{75} The Ninth Circuit held that the machine had not been "on sale" within the meaning of section 102(b) because no fully operative machine had been completed.\textsuperscript{76}

\textsuperscript{69} \textit{Id.} at 137. Reduction to practice is a term of art which developed from interference practice as a tool to determine priority between two rival inventors. \textit{Id.} at 135-36. Interference practice concerns the priority of invention. The basis for the interference proceeding is the policy of the United States to award a patent only to the first inventor. 35 U.S.C. § 102(g) (1982). This is in contradistinction to the majority of other countries which award a patent based on first to file. An interference can be declared only between cases claiming substantially the same invention and it must also appear that there exists a reasonable possibility that the junior party will prevail. The Board of Patent Interferences formally institutes and declares the interference. The party who ultimately prevails will be entitled to claim only that for which there is complete support in his patent application. See P.D. Rosenberg, \textit{Patent Law}, supra note 2, at 147-48.

\textsuperscript{70} See 2 Chisum, supra note 22, at § 10.06. See also \textit{Corona Cord Tire Co. v. Dowan Chem. Corp.}, 276 U.S. 358 (1928). "A process is reduced to practice when it is successfully performed. A machine is reduced to practice when it is assembled, adjusted, and used. A manufacture is reduced to practice when it is completely manufactured. A composition of matter is reduced to practice when it is completely composed." \textit{Id.} at 383.

\textsuperscript{71} See Note, \textit{New Guidelines}, supra note 7, at 743. A simple improvement to an already existing mechanical device may be obvious from detailed plans or a crude mockup.

\textsuperscript{72} See Zieg, supra note 10, at 499-500.

\textsuperscript{73} 316 F.2d 459, 460-61 (9th Cir.), \textit{cert. denied}, 375 U.S. 902 (1963).

\textsuperscript{74} 316 F.2d at 462.

\textsuperscript{75} \textit{Id.} at 461.

\textsuperscript{76} \textit{Id.} at 465.
In contrast to *Americo*, the court in *Langsett v. Marmet Corp.* held a patent invalid under section 102(b) where no complete operative model of the invention existed. The case involved an aluminum window frame designed to prevent condensation from forming on the inside of the frame. Before the critical date, the inventor showed drawings of the proposed frames as well as sections of a corner of a window as a sample to some experienced architects. The architects were satisfied with the invention's feasibility and included drawings of them in a bid proposal. The court found that the invention had been reduced to practice because a complete showing of the frame had been made to the architects, and the inventor had confidence in the workability of the invention.

When an ambiguity as to whether the invention was reduced to practice exists, the inventor's intent regarding his activities becomes important. This is illustrated in *Philco Corp. v. Admiral Corp.* Admiral contended that the Philco patent was invalid because of "on sale" activities prior to one year of the filing date. Philco had invited one of its largest distributors, Firestone, to a secret showing of Philco's new television sets before public release and prior to the critical date of several Philco patents. The sets shown to Firestone were handmade mock-ups and could not perform electronically. At the showing, Firestone indicated the quantities of sets they wanted delivered when the sets were available. The court held the patents invalid because Philco made a "competitive" showing more than one year prior to the application date. The court held that the showing was a sales effort. The court found that Philco intended to gain a competitive advantage over other television manufacturers and that Philco was confident of the completeness of the invention. The court further determined that the commercial exploitation beyond the one-year mark undermined the statutory balance of policies.

In *Timely Products Corp. v. Arron*, the Second Circuit Court of Appeals devised a three-part test to determine when a patent application would be barred under section 102(b). In *Timely Products*, the patent in dispute related to improved battery-heated socks. Prior to the critical date, an advertisement

for similar heated socks, which were covered by a patent owned by the same inventor, appeared in a national magazine.\textsuperscript{91} Evidence further established that the inventor showed samples of the improved socks to a potential customer and solicited orders.\textsuperscript{92} The patent owner, relying on the "on hand" doctrine, argued that the "on sale" bar did not apply because the improved socks were not actually available for delivery until after the critical date.\textsuperscript{93} The inventor claimed that in order for an invention to be on sale under the "on hand" doctrine, the invention must have existed in its usable form and be "on hand" and ready for delivery prior to the critical date.\textsuperscript{94}

The court rejected the "on hand" doctrine, concluding that the doctrine often produced results contrary to the basic policies underlying section 102(b).\textsuperscript{95} In its place, the court set forth a three-part test which required that: 1) the invention be embodied in or be obvious in view of the object offered; 2) the invention have been tested to verify its operability; 3) the sale be primarily for profit.\textsuperscript{96}

The court found that the socks offered for sale had been made, were successfully tested, and that the inventor's purpose was purely commercial.\textsuperscript{97} Although the socks actually offered were not the improved model of the

\textsuperscript{92.} Id.
\textsuperscript{93.} Id. See generally 2 Chisum, supra note 52, at § 6.02[6] (historical background to "on hand" doctrine); Note, New Guidelines, supra note 7, at 736 (describes declining use of the "on hand" doctrine).
\textsuperscript{94.} Note, New Guidelines, supra note 7, at 736. The courts, when following the "on hand" doctrine, found an invention to be on sale when they were on hand ready for delivery regardless whether it had been sold or not. Burke Elec. Co. v. Independent Pneumatic Tool Co., 234 F. 93 (2d Cir.), cert. denied, 241 U.S. 682 (1916). Thus, where shelf articles were on hand and ready for delivery, any offer for sale put them "on sale" and caused a forfeiture of rights if both conditions occurred prior to the critical date.
\textsuperscript{95.} 523 F.2d at 302. The court cited Judge Learned Hand's opinion in Metallizing Eng'g Co. v. Kenyon Bearing & Auto Parts Co., 153 F.2d 516 (2d Cir.), cert. denied, 382 U.S. 840, rehg. denied, 382 U.S. 881 (1946), wherein it was "reasoned that an inventor should not be allowed to use an invention commercially, even though secretly, for more than one year prior to his application, because this would effectively extend the limited monopoly created by the patent laws." 523 F.2d at 302.
\textsuperscript{96.} In its entirety, the test provides:
(1) The complete invention claimed must have been embodied in or obvious in view of the thing offered for sale [cites omitted]. Complete readability of the claim on the thing offered is not required because whatever is published (or sale) more than one year prior to the filing of a patent application becomes part of the prior art over which the claim must be patentable;
(2) The invention must have been tested sufficiently to verify that it is operable and commercially marketable. This is simply another way of expressing the principle that an invention cannot be offered for sale until it is completed, which requires not merely its conception but its reduction to practice;
(3) Finally, the sale must be primarily for profit rather than for experimental purposes [cites omitted].
\textsuperscript{97.} Id. at 302 (citations omitted).
patent in dispute, the court agreed with the district court that the improved model was obvious in light of the item displayed. The patent was held invalid because the invention was on sale more than one year prior to the application of patent, contrary to the provisions of section 102(b).

Courts began applying the *Timely Products* three-part test immediately. In *General Electric Company v. United States*, the Court of Claims adopted a number of the Second Circuit's general rules relating to the "on sale" bar, including the four underlying policies of section 102(b). General Electric ("GE") sued the United States seeking compensation for the unauthorized use of GE's patented gyroscope invention. GE claimed that five competing companies had manufactured GE's invention for the government. In defense, the United States contended that GE's invention had been on sale prior to the critical date and therefore, pursuant to section 102(b), the patent was invalid. GE, in defending against the "on sale" bar claim, argued that the prototype had not been "reduced to practice" prior to the critical date.

The court reviewed the holdings of various circuit courts and concluded that no controlling authority conclusively resolved whether reduction to practice by one other than the inventor or one under his control is a prerequisite to the "on sale" bar. However, if the invention has been reduced to practice, then precedent clearly holds that section 102(b) applies when an unrelated third party has placed the invention on sale. The court reviewed the four policies underlying section 102(b) and concluded that when an unrelated third party places the invention on sale neither the policy favoring the filing of only worthwhile inventions nor the policy against extended commercial exploitation was implicated. However, the court did find that the two other considerations, the policy against removing inventions from the public domain and the policy favoring early patent filing, were sufficiently important to require the invalidation of a patent when a third party placed the invention on sale. Although the court did not reach the issue of whether reduction to practice is an absolute requirement of the "on sale" bar, it did suggest that a strict

104. *Id.* at 60.
105. *Id.* at 60-61.
106. *Id.* at 61-62. Compare this to the situation where the patent in dispute is related to a process for making a product and a third party has merely sold the product for more than one year prior to the critical date while keeping the process secret. As long as it was not evident from the product sold what process was used to produce it, then the patent will not be held invalid. W.L. Gore & Assoc., Inc. v. Garlock, Inc., 721 F.2d 1540 (Fed. Cir. 1983).
107. 654 F.2d at 61.
108. *Id.* at 62.
requirement of reduction to practice could frustrate the two former policies.\textsuperscript{109}

In comparing GE's patented invention to the prototype, the *General Electric* court found that what is claimed as the invention does not need to be exactly identical to what was actually offered or sold.\textsuperscript{110} Relying on *Timely Products*, the court stated that if the claimed invention was obvious in view of the thing offered for sale prior to the critical date, then the patent would be invalid.\textsuperscript{111}

In 1982, the Federal Circuit Court of Appeals was created to interpret and develop the rules and principles of patent law.\textsuperscript{112} The holdings of the Court of Claims and the Court of Customs and Patent Appeals ("CCPA") constituted precedent for the Federal Circuit.\textsuperscript{113} Since its creation, the Federal Circuit has had few opportunities to rule on the issue of completeness of the invention or reduction to practice.\textsuperscript{114}

The Federal Circuit directly addressed the reduction to practice question in *Barmag Barmer Maschinenfabrik AG v. Murata Machinery Ltd.*\textsuperscript{115} There, the patent in dispute related to a machine for processing filament yarn.\textsuperscript{116} More than one year prior to the application date, the patent owner engaged in detailed negotiations with a potential buyer resulting in a purchase order for two machines after the critical date.\textsuperscript{117} Prior to the critical date, however, only a makeshift prototype machine existed.\textsuperscript{118}

In defense of the "on sale" bar claim, the patent owner in *Barmag* asserted that the bar did not apply because the invention was neither complete nor sufficiently tested to verify operability and commercial marketability.\textsuperscript{119} The *Barmag* court defined "complete" according the *Timely Products* test, as meaning that each element of the claimed patent must be found in the thing

\textsuperscript{109} Id.

offered for sale, or the claimed invention as a whole must have been obvious from the thing offered for sale. The court held that whether the device was offered for sale as a make-shift prototype is immaterial under the first part of the *Timely Products* test.

The *Barmag* court also examined the degree of testing required for application of the "on sale" bar and held that the *Timely Products* test does not require commercial marketability in addition to requiring reduction to practice. Once the invention has been reduced to practice, the invention is "complete," operable, and commercially marketable. The court reiterated the holding of the Court of Claims in *General Electric* that reduction to practice requires only that an invention be sufficiently tested to demonstrate it will work for its intended purpose. Moreover, the invention need not be in a commercially satisfactory stage of development when tested. The court also specifically rejected the "on hand" test, relied on in early cases, as a requirement of section 102(b).

The *Barmag* court affirmed the district court's finding that the invention was on sale under the *Timely Products* three-part test. The court, however, retreated from its predecessor's unqualified acceptance of the test, stating that the test is not the answer for all cases. The Federal Circuit emphasized that the *Timely Products* test, while requiring less than the "on hand" standard, is still restrictive because it requires a physical embodiment of the thing offered for sale prior to the critical date before the bar is triggered. Moreover, the court found that a situation could possibly arise where, because the commercial benefits prior to the critical date were great, the lack of a physical embodiment of the invention would defeat the policy of prohibiting commercial exploitation. This situation arises where the invention is simple in nature and not based on complex technology and therefore does not require extensive testing to prove its utility. The Federal Circuit deferred to the lower court's finding that the *Timely Products* test had been met, and therefore did not consider whether a less stringent standard should be enunciated.

In a more recent case, *Western Marine Electronics v. Furuno Electric Co.*, the Federal Circuit noted that the "on sale" bar is difficult to apply and that

rigid standards tend to undermine the policies implicated by the doctrine. The patent owner, Wesmar, appealed a ruling which invalidated four claims of its United States patent. The patented invention was a gravity-stabilized sonar device for fishing boats. Wesmar argued that the "on sale" bar did not apply because the invention had not been reduced to practice even though an offer to sell had been made. The device had not been mounted on a boat and, therefore, had not been sufficiently tested. The Federal Circuit stated that a bare offer to sell cannot be viewed in a vacuum, but must be considered in connection with the facts and circumstances of each case weighed in view of the underlying public policies. To effectuate the underlying policies, the Federal Circuit found that the totality of circumstances must be considered. Consideration must be given to the character and extent of commercial activities, the type of invention and its stage of development as evidenced by engineering models, along with the character and extent of experimentation. The Federal Circuit agreed with the trial court that the totality of the circumstances supported a finding that the invention, as embodied in a structure meeting all the elements of the claim, was reduced to practice.

In summary, the Federal Circuit has not explicitly held that reduction to practice is an absolute requirement of the "on sale" bar provision of section 102(b). However, the Federal Circuit has assumed from the holdings of its predecessor courts that an invention must have been reduced to practice more than one year before the filing of a patent application before the "on sale" bar is triggered.

II. UMC ELECTRONICS v. UNITED STATES

In UMC Electronics v. United States, the Federal Circuit, for the first time since its creation, addressed whether reduction to practice was an absolute requirement of the "on sale" bar. The court reviewed its past decisions and those of its predecessors before ruling that reduction to practice "has not been and should not be made an absolute requirement of the on sale bar."
A. Factual and Procedural History

In 1980, UMC sued the United States government, pursuant to 28 U.S.C. section 1498(a), to recover compensation for use of its patented aviation counting accelerometer ("ACA"). The application for the accelerometer patent was filed on August 1, 1968. Since 1966, UMC had been developing an improved ACA which was capable of distinguishing between acceleration due to maneuvers and acceleration from other sources, such as wind gusts or weapons release. In 1967, UMC built and tested an engineering prototype which incorporated a novel sensor component.

On July 27, 1967, five days prior to the critical date, UMC submitted a written bid proposal to the Navy to supply 1.7 million dollars worth of its ACA devices. In the proposal, UMC described its ACA device and stated that the sensor portion "has been constructed and tested." On August 2, 1967, one day after the critical date, UMC submitted a technical proposal which described its ACA device in detail and included test results and schematic drawings. Seven days later, UMC gave a demonstration of the device to the Navy. The Navy canceled the request and issued another later in 1968. The later proposal eventually led to a contract between the Navy and another company, Systron-Donner. For the next several years, UMC sought compensation directly from the Navy, claiming that the Navy's use of the Systron-Donner ACA was an infringement of UMC's patent.

The Court of Claims upheld the validity of the UMC patent, which the government challenged on a number of grounds, including the "on sale" bar of section 102(b). However, the court found that no infringement had occurred and dismissed the complaint. In rejecting the "on sale" bar argument, the Court of Claims used the three-part Timely Products test. The court held that the invention had been reduced to practice prior to the critical date, but that the complete invention was not embodied in the "thing" offered for sale because the engineering prototype did not include all the elements of the claims nor would the patented invention have been obvious in view of the prototype. Both parties appealed. UMC asked for reversal of the finding of non-infringement, and the government sought to have the claims invalidated.

155. UMC Electronics Co., 816 F.2d at 651.
B. On Appeal to the Federal Circuit—Majority Opinion

A majority of the Federal Circuit affirmed the Court of Claims’ dismissal of the suit against the government, but based its decision on different grounds. The Federal Circuit found that the patented UMC invention was on sale more than one year before the patent application was filed. Accordingly, the court held that all claims of the patent were invalid. 156

The majority began its opinion by redefining what UMC offered for sale. The Federal Circuit found that it was not UMC’s prototype which was the “thing” offered for sale in the written bid proposal of July 27. 157 The subject matter of the proposal was the claimed invention. Next, the court corrected the apparent inconsistency in the Court of Claims’ conclusion that the claimed invention was reduced to practice before the critical date and its finding that no physical embodiment of the invention existed at the time. 158 Considering that no physical embodiment containing all limitations of the invention existed before the critical date, the court found that the invention could not have been “reduced to practice” within the meaning established by earlier cases. 159 The government, however, argued that the bar should apply despite the absence of a complete physical embodiment because UMC had commercially exploited the invention. Such activity, the government argued, contravened the policies underlying section 102(b). 160

The majority agreed with the government’s contention that the four policies underlying the bar are controlling and that reduction to practice is not always a requirement of the “on sale” bar. 161 In support, the court relied on Barmag Barmer Maschinenfabrik AG v. Murata Machinery Ltd., 162 emphasizing that the court in that case had gone “out of its way to reserve the question whether a physical embodiment should be a requirement of the ‘on sale’ bar in all cases.” 163 The UMC court also noted that in a number of earlier decisions, the factual findings leading to a conclusion that there was no “on sale” bar appeared to be based on the assumption that reduction to practice is required, even though the term “reduction to practice” was not mentioned in the decisions. 164 Moreover, the Federal Circuit noted that the caselaw of other courts was not

164. UMC Electronics Co., 816 F.2d at 653.
165. Id. at 654. See Shatterproof Glass Corp. v. Libbey Owens Ford Co., 758 F.2d 613 (Fed. Cir. 1985), cert. dismissed, 106 S. Ct. 340 (1985) (“on sale” bar not applicable where reasonable jury could have found that apparatus and method of claims were not functional); In re Dybel, 524 F.2d 1393 (C.C.P.A. 1975) (invention not in existence until installed on another device as called for by the patent claims).
uniform, with some circuit courts attempting to "shoehorn the reduction to practice requirement concept into the on sale bar analysis" by adopting a "sufficiently" reduced to practice requirement. The court viewed this modified "reduction to practice" requirement as a departure from the traditional concept. Because "reduction to practice" is a term of art developed in connection with interference practice, the majority found that its modified use in application to the "on sale" bar would cause confusion in interference law. Thus, any specific ruling in one context would impact upon the other area of law. Conversely, the court found that a strict application of the reduction to practice requirement as developed in interference law, would enable an inventor to escape the "on sale" bar simply through deft claim draftsmanship.

In further support of its holding that reduction to practice is not a per se requirement of the "on sale" bar, the Federal Circuit noted the inherent inconsistency of the Timely Products three-part test. The first part of the test can be satisfied if the claimed invention would have been obvious in view of the "thing" offered for sale. Satisfaction of the second part of the test requires that the invention be reduced to practice. The court found that an absence of reduction to practice of the claimed invention is implicit in the obviousness standard. Because the first part of the test can apply to situations where the "thing" offered for sale does not embody all of the elements of the claimed invention, the invention cannot be the subject of the sale. Therefore, the first and second parts of the Timely Products test are mutually exclusive. The Federal Circuit's reasoning assumed that the reduction to practice requirement is satisfied only when the precise invention expressed in a claim is physically embodied in the "thing" offered for sale. According to the first prong of the test, the bar is applicable if the claimed invention is merely obvious in view of the thing offered for sale. Although the court held that reduction to practice was not an absolute requirement, the majority noted that it is still an important tool in an "on sale" analysis. Moreover, proof that an invention had been reduced to practice prior to the critical date would lessen the burden on the party asserting the bar. It is more likely that the manufacturer would

166. UMC Electronics Co., 816 F.2d at 655. The Federal Circuit cited to five circuit courts of appeals to support its conclusion that regional circuits have previously given only lip service to a requirement of reduction to practice as part of the on-sale bar. Id.

167. Id. See Barmag Barmer Maschinenfabrik v. Murata Machinery Ltd., 731 F.2d 831 (Fed. Cir. 1984) (Federal Circuit discerns no distinction in their precedents between interference cases and "on-sale" cases with respect to meaning of "reduction to practice").

168. UMC Electronics Co., 816 F.2d at 655. Id. at 655. As an example of such claim draftsmanship, CAFC used an example where the patentee could have claimed "an aircraft with an ACA" vs. just "an ACA." Based on the former, the invention would not be reduced to practice unless the entire ACA was installed on an aircraft. Id. at 655 n.10.

170. Id. at 656.
171. Id.
172. Id.
173. Id. at 656.
market a product which had been thoroughly developed and tested. Further, the court stated that its holding did not lend itself to precise requirements.\textsuperscript{174} However, the party asserting the bar must prove there was a definite sale or offer to sell more than one year before the patent application, and that the subject matter of the sale or offer to sell fully anticipated the claimed invention or would have rendered the claimed invention obvious by its addition to the prior art.\textsuperscript{175} Once this is established, the burden shifts to the patent holder to explain why his activities would not activate the bar.\textsuperscript{176} In determining whether something less than a complete embodiment of the invention will suffice under the "on sale" bar, the court recommended that several factors be considered: the intent of the inventor; the degree of development of the invention; the commercial activities; and the testing conducted to satisfy the inventor that the invention would work.\textsuperscript{177}

Applying these principles, the Federal Circuit found that UMC's written proposal constituted a definite offer to sell its ACA device. The offer occurred more than one year prior to the date of the patent application and, as UMC admitted, the offer was made for commercial purposes.\textsuperscript{178} The court held that these activities were prima facie evidence of UMC's attempt to expand the one-year grace period and, thus, violated the policies underlying section 102(b).\textsuperscript{179} UMC attempted to rebut the prima facie evidence by arguing that the ACA device was not fully developed at the time of the offer. The court found the evidence supporting this argument insufficient. Accordingly, the court invalidated all the claims of the UMC patent.\textsuperscript{180}

\textbf{C. Dissenting Opinion}

In a strong dissenting opinion, Judge Smith accused the panel majority of "disembody[ing] a fundamental principle of patent law which a respectable body of precedent holds to exist."\textsuperscript{181} The dissent emphasized the importance of stability in the law, and stated that the court failed to give adequate consideration to stare decisis and its underlying policies.\textsuperscript{182} Moreover, the adopted jurisprudence of the Federal Circuit's predecessors can only be over-
ruled by the court sitting en banc. The dissent argued that past decisions have held that the classical definition of reduction to practice—that a device must be in existence and shown to work for its intended purpose—was a threshold requirement for the “on sale” bar. Judge Smith argued that it was important that an inventor know precisely when the bar begins to run because a violation of section 102(b) results in an irretrievable loss of a valuable right to a patent.

In contrast to the majority, the dissent did not find the three-part test of *Timely Products* inherently inconsistent. Instead, the dissent’s interpretation of the test focused on the object or “thing” offered for sale. For the bar to apply, the “thing” offered for sale must have been completed and shown to work for its intended purpose, i.e. reduced to practice, prior to the critical date. The “thing” offered did not necessarily have to have been the claimed invention. The bar would apply if the invention would have been obvious in view of the “thing” offered, provided the “thing” was reduced to practice. The dissent concluded that because the “thing” offered by UMC to the Navy on July 27, 1967 was a bid proposal, and the invention was not reduced to practice, the bar was not applicable.

III. ANALYSIS OF UMC ELECTRONICS v. UNITED STATES

The majority holding in *UMC* does not substantially change the law concerning issues related to the “on sale” bar, it merely establishes that the four basic policies reflected in section 102(b) should be considered when a court determines whether an inventor has placed a claimed invention on sale more than one year prior to the patent application filing date. By holding that reduction to practice is not an absolute requirement of the “on sale” bar, the majority sought to confine the “reduction to practice” requirement to its traditional sphere in the highly technical patent interference practice. Although the majority did not establish a rigid set of rules which are easily applied, their approach minimizes the potential for circumventing the objectives of patent law.

The majority did not view its holding as overturning its own precedent or that of its predecessor courts because there was no definitive position either way on the issue of whether “reduction to practice” was an absolute requirement of the “on sale” bar. Only two prior cases directly addressed the issue

183. *South Corp.*, 690 F.2d at 1370. *See also* Kimberly-Clark Corp. v. Fort Howard Paper Co., 772 F.2d 860 (Fed. Cir. 1985) (Federal Circuit specifically states that only a majority sitting en banc may overrule precedent).

185. *Id.* *See supra* note 5.

186. *UMC Electronics Co.*, 816 F.2d at 661.

187. *Id.* at 665.

188. *Id.* at 654. *See also* NLRB v. Boeing Co., 412 U.S. 67, 72 (1973) (premise assumed in earlier cases is rejected when court was, at last, “squarely presented with the issue”).
and in neither instance did the court give a definite answer. Additionally, the holding in UMC is consistent with the text of section 102(b). The term "reduction to practice" does not appear in this section. Only in section 102(g), which is the basis for interference claims, does the term appear.

The majority position directly addresses two of the policy concerns behind the "on sale" bar. The first is the policy which prohibits an inventor from unreasonably extending his seventeen year monopoly guaranteed by the patent grant. UMC began its commercial exploitation more than one year prior to the date the patent application was filed. Thus, UMC availed itself not only of the seventeen year grant but also of the one year grace period as provided in section 102(b). The other policy which supports the outcome in UMC is the inventor's interest in having a reasonable amount of time following sales activity to determine whether a patent is a worthwhile investment.

These two policies support the contention that substantial commercial exploitation of a claimed invention could raise an "on sale" bar, despite the absence of a complete physical embodiment. The factual situation in UMC was similar to that of Langsett v. Marmet Corp. and Philco Corp. v. Admiral Corp. In all three cases, the inventor disclosed to potential customers either details of his invention, partial completed samples, or a nonfunctional mock-up. In none of the cases was a complete physical embodiment of the invention commercially exploited. In other words, in none of the cases was the claimed invention "reduced to practice," in the interference sense, prior to the critical date. In the absence of an invention which had been reduced to practice, the courts employed the "totality of the circumstances" analysis to find that each of the inventions was "on sale" within the meaning of section 102(b).

As noted in the UMC dissent, the risk involved in not requiring a working embodiment of the invention as the threshold condition to a determination of an "on sale" bar is to force premature entry into the patent system by inventors who are still developing their inventions. This premature entry

190. See Colman, supra note 8, at 677-79.
191. A person shall be entitled to a patent unless—(g) before the applicant's invention thereof the invention was made in this country by another who had not abandoned, suppressed, or concealed it. In determining priority of invention there shall be considered not only the respective dates of conception and reduction to practice of the invention, but also the reasonable diligence of one who was first to conceive and last to reduce to practice, from a time prior to conception by the other.
194. See, e.g., Philco, 199 F. Supp. at 817 (whether an item is "on sale" is a question of fact to be determined upon all the evidence and in light of all circumstances of case).
195. UMC Electronics Corp., 816 F.2d at 664-65.
wastes not only the resources of the inventor but also the resources of the Patent Office. The predicted rush to the Patent Office can be avoided if the inventor carefully examines his own factual situation and compares it to the "totality of circumstances" considerations that the majority set forth.

Most important in the "totality of circumstances" standard is the degree of confidence that the inventor has in the completeness of his invention. This is measured by the inventor's level of commercial activity and the amount of testing performed by the inventor. Commercial activity, such as the government contract bidding in UMC, is strong evidence that the inventor is confident that the invention is feasible and has progressed beyond the mere conception of an idea. Other probative evidence would be the existence of a marketing plan, the scope and breadth of a research program, and whether production of raw materials has been established. The less complex the invention is, the easier it will be for the inventor to have the requisite confidence. This consideration addresses the concern of the Barmag court, which stated that the physical embodiment requirement of the three-part Timely Products test would defeat the policy prohibiting commercial exploitation beyond the statutory one-year grace period. Application of the Timely Products test to the fact situation in Langsett would have caused the court to reach a contrary result. No physical embodiment of the window frame existed at the time the invention was placed on sale. The court examined the circumstances surrounding the inventor's proposal to the architect and found that the inventor had such confidence in the workability of the window frame that the architect, through his activities, commercialized the invention.

Also relevant in the determination of whether the invention is "on sale" is the degree of disclosure by the inventor of the invention's details. Disclosure is an act which communicates a real expression of the "concept" of the invention. An oral or written description, embodying all of the structural elements of the invention, may alone be enough to satisfy the totality of circumstances standard. Thus, the existence of a diagramatic or written explanation, if it is precise enough to enable one of ordinary skill to manufacture the invention, may be sufficient to trigger the running of the bar. This is especially true if it can be proved that the customer understood that the device being offered or described to him comprised the invention later patented. However, the policies underlying the "on sale" bar focus on the attempt by the inventor to exploit his invention, not whether the potential purchaser was cognizant of the invention. Accordingly, the purchaser need not have actual knowledge of the invention for the invention to be considered on sale.

197. Langsett, 231 F.Supp at 768.
198. See Colman, supra note 8, at 677-79.
199. Id.
200. See In re Blaisdell, 242 F.2d 799, 783 (C.C.P.A. 1957) (Tapered shim for crankshafts installed on car and sold to third party without disclosure of the shim can constitute "on sale activity").
The other two policies underlying the "on sale" bar are of secondary importance to the UMC decision. The policy against removing inventions from the public domain, and the policy favoring prompt and widespread disclosure to the public of new inventions, deserve less consideration given the nature of the invention in UMC. The ACA is a sophisticated electronic device which has a very specific and limited use. As such, the importance of disclosing the device to the public in general is not overwhelming. Likewise, the commercial exploitation by UMC through the United States Navy bid proposal probably did not cause the public to justifiably believe that the ACA device was available to all without patent protection.

One problem created by the majority's holding is the uncertainty as to when the bar begins to run. Without a precise standard, such as the reduction to practice requirement, the inventor cannot be certain when his statutory one-year grace period begins. As noted by the dissent, the consequences of the failure to perceive the point at which the bar begins are severe. Such failure results in an irretrievable forfeiture of the right to a patent. However, this situation can be avoided if the inventor accepts the notion that the clock begins the moment the first offer to sell is made. Therefore, once the inventor has mustered his confidence that his invention is commercially marketable, and he has made some disclosure to a potential customer, he should decide within one year from that time whether to seek patent protection or to take his chances in the market.

The dissent defended the Timely Product three-part test from the majority's claim that it is inherently inconsistent. The test, according to the dissent, is based on the premise that it is the "thing" offered for sale which must be reduced to practice, regardless of whether the "thing" offered is the claimed invention.\textsuperscript{201} This reasoning is sound when the facts are similar to those in Timely Products. There the "thing" offered was covered by a patent, although not the patent in dispute. However, where the "thing" offered is not covered by a patent, then there exists no basis upon which to determine whether the "thing" has been reduced to practice. Using the majority's "totality of circumstances" standard avoids this problem. Under this standard, the "thing" offered is examined only to determine whether the claimed invention would have been obvious.

\textbf{IV. IMPACT}

As a result of the UMC decision, an aspect of certainty is sacrificed to satisfy the underlying public policies. Without a mechanically applied set of rules or the reduction to practice standard, neither the inventor nor the patent attorney will know how the time limit for filing a patent application will be measured or where the line will be drawn between raw idea and proved invention. This could stifle the inventive process because inventors, fearful of

\textsuperscript{201} See supra note 186.
triggering the bar, would be hesitant to seek financing or test the market potential before they had made a workable device. Alternatively, the lack of certainty may force the inventor to file patent applications prematurely to protect untested and speculative ideas. This possibility would contravene the purpose of the patent system which is to encourage the creation of useful inventions, not bare ideas.202

In light of the historical difficulties with interpreting the phrase “on sale” and the potential difficulties arising from the Federal Circuit’s holding in UMC, the following method for determining whether an invention was “on sale” within the meaning of section 102(b) is proposed. This step-by-step method is a modified and updated version of a previously proposed test.203

First, the court must examine whether there was an offer to sell, an executory sale, or an executed sale prior to the critical date. Although only a single offer is needed, it is necessary that some commercial exploitation occur to trigger the “on sale” bar. Commercial exploitation may be conducted by anyone, either openly or surreptitiously. However, an inventor who is merely seeking developmental assistance would not be considered to have placed his invention on sale.204 This is the experimental exception to the “on sale” bar.205

If no commercial exploitation occurred prior to the critical date, then the “on sale” bar is inapplicable. However, if commercial activity is identified, the inquiry must proceed. Applying this first step to the facts in UMC indicates that the submission of the bid proposal clearly constituted commercial activity. The proposal was an offer of the ACA device for sale. Further, UMC admitted that the offer was made for profit and not merely to conduct experiments.

Second, the court must evaluate all the circumstances surrounding the commercial exploitation and weigh them against the four policies underlying the statute. If the “thing” offered for sale prior to the critical date was a complete physical embodiment of the claimed invention, then clearly the “on sale” bar applies. Both parties and the court in UMC agreed that there was no physical embodiment containing all limitations of the claimed invention before the critical date. Where the “thing” offered lacks one or more critical elements of the claimed invention, then it should be determined whether the claimed invention would have been obvious to one skilled in the art in view of the “thing” offered. If so, then the bar applies. If not, further examination of the circumstances is warranted. A variety of facts surrounding the offer

202. See supra note 21.
203. See Note, New Guidelines, supra note 7, at 746-47 (original test assumed reduction to practice was a requirement and did not account for the obviousness test set forth in Timely Products).
204. See D.L. Auld Co. v. Chroma Graphics Corp., 714 F.2d 1144, 1150 (Fed. Cir. 1983). However, the experimental exception applies only if the commercial exploitation is merely incidental to the primary purpose of experimentation to perfect the invention. Barmag Barmer Maschinenfabrik v. Murata Machinery Ltd., 731 F.2d 831, 838 (Fed. Cir. 1984 (citing to In re Thais, 610 F.2d 786, 793 (C.C.P.A. 1979)).
205. See supra note 51.
for sale constitute the totality of circumstances which should be examined. The inventor's conduct and intent indicates the degree of confidence the inventor has in his invention. Likewise, the acceptance by a potential buyer is an indication of the completeness of the invention. Another important factor is the amount of testing that was conducted to satisfy the inventor that the invention would work. Also, the nature of the invention is important as a simple invention may require little or no testing, while a more complex invention may require extensive testing.

Finally, the court should consider the degree of development of the invention at the time of the offer. This evaluation would measure the completeness of the invention. A comparison of the facts in UMC with these factors shows that the ACA device was not a simple invention. However, evidence established that the device was well developed and had been tested. The inventor was also confident that the device would work. This confidence was manifested by his intent to supply the United States Navy with over 1.6 million dollars worth of the devices.

Application of this proposed step-by-step method would have alerted the inventor in UMC at the time the bid proposal was made to actively seek patent protection. By promptly filing a patent application within one year, the "on sale" bar issue could have easily been avoided.

V. CONCLUSION

For the first time since its creation in 1982, the Federal Circuit has expressly ruled on whether "reduction to practice" is necessary before an invention is found to have been "on sale" within the meaning of 35 U.S.C. section 102(b). In UMC Electronics v. United States, a majority held that a reduction to practice is not absolutely required, proposing instead that a totality of circumstances standard be used. This standard weighs factors such as the nature of the invention, the inventor's confidence, and the degree of development and testing against the underlying policies of the "on sale" provision of section 102(b).

Under the UMC decision, inventors and patent attorneys will not have a clear and easily applied standard to determine when the bar begins to run. This lack of certainty may inhibit inventors from seeking outside financing or testing potential markets for fear of triggering the bar. Moreover, inventors may prematurely file patent applications before their inventions are sufficiently developed to meet the disclosure requirements imposed by section 112 of Title 35. It is proposed, however, that the one-year grace period begins to run at the moment of the first offer to sell, regardless of whether or not a physical embodiment exists. Albeit conservative, this rule would prevent the irretrievable loss of the valuable right to a patent.
